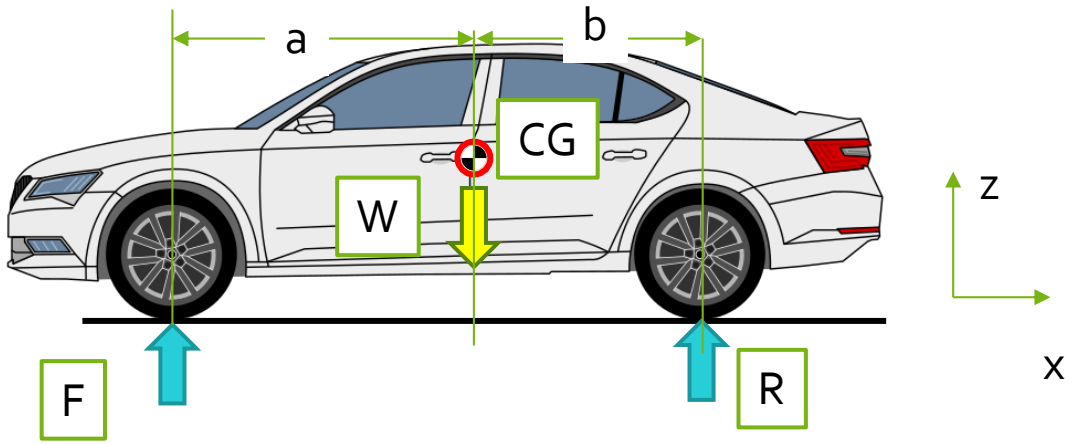
Static Vehicle Weight distribution Problem

A car weights 2500 kg
When measured on a Weighing platform at four wheels
Reading at Front (left and Right) wheel is 1300 kg
Reading at Rear (left and righto is 1200 kg
Find location of CG on x axis "a" and "b" s
The wheel base of vehicle is 2700 mm



$$\frac{R}{F} = \frac{a}{b}$$

$$\frac{1200}{1300} = \frac{a}{b}$$

$$a + b = 2.700\ m$$

$$b = 2700\ - a$$

$$\frac{1200}{1300} = \frac{a}{2.7\ - a}$$

$$3240 - 1200a = 1300a$$

$$3240 - 1200a = 1300a$$

$$a = 1.296m \qquad b = 1.404\ m$$
